

Ending Genetic Engineering & Associated Atrocities In Australia & Clean Up Proposals

By John Kahler.

(Updated on 14th of November, 2019.)

Genetic engineering, cloning and other related immoral, unethical and shameful practises in the world have gone on far too long, often unchecked and ignored. While we have laws against the likes of murder, stealing, rape and child molestation, corporate greed and an abuse of the lack of laws preventing the initial mentioned activities, has caused a widespread growth, instead of ending these tactics. Plants and animals have almost become like slaves to the whim of any conscienceless rogue scientists. Entire species could be put at risk and other side-effects are largely unknown.

As of November 2019, the current Australian government has been corrupted further by inconceivable decisions made by certain politicians, to actually join with the criminals involved in these practises. It is one offence that they should be taking place, but to openly support them, and allow them into the environment, makes them equally as guilty and completely irresponsible.

They government has so far not adequately protected the people they work for, and have exposed us and the environment to any amount of genetically engineered organisms, both plants and animals, like terrorists, with no concern for the effects this will have on the future of the planet.

We need to see that these specific leaders are held to justice for their actions, as well as the corporations and organisations responsible for releasing any GMOs into the wild, as it were. This will also inevitably affect foreign trade in both the import and export markets. Externally, other countries, such as China, and parts of Europe, will want to avoid the risk of Australia's unlabelled goods, and internally, more companies who actually care about what products they use, will be sourcing them from overseas.

Those of us who want nothing to do with these disgusting practises have seemingly been cast aside and told pitiful excuses by certain government members, that nothing is wrong, and that we should effectively be as conscienceless as various pro-GE members are.

Parties such as the Greens however, have agreed in so far as regulating things, but ultimately we should work towards a ban, as this is not a totally acceptable situation.

It has so far made no sense to expose farmers & small home growers to GMOs, instead of those who are responsible, keeping them isolated. If this were to be compared with the likes of a virus, then currently the government is allowing a DELIBERATE, mass infection. If species such as marine & bird life were to be affected, we are potentially a danger to other nations as well.

If we are to move forward, things have to be drastically changed. Australia should also be at the forefront of the organic industry, promoting natural crop growing and medicines, and be an example to other countries. The government needs to implement mandatory labelling on all products still using any GMOs until they can ultimately be banned entirely. This is an issue that has been constantly ignored, because they know people want nothing to do with such things, and they want to be able to keep on supporting the corrupt corporations by allowing them to do such things in "secret."

It is time that people can make a conscience decision in this regard, and we need the government to be more conscience, because that is one of the right and fundamental parts of having a civilised society.

Below are the steps which need to be addressed immediately to reverse the catastrophic effects currently being allowed.

1. The immediate termination of all such “works” by corporations and any institutions supporting these immoral activities. Any continuation should result in heavy fines and imprisonment where necessary. New laws should be enforced to help protect the population from such activities, unlike now, where these activities have been ignored, allowed & in some situations, even *promoted*. The prevention of such activities occurring again in the future.

2. The identification of corrupted crops around the country. This could be quite awkward to achieve, but perhaps by local councils in each area and ideally the removal of such crops, either by complete incineration or any other means of isolation which will ensure no contaminating properties still exist, such as seeds.

3. An extension to point 2, with park rangers, gardeners and the like, identifying any missed specimens in the future which may have sprung up in the wild, to the extent that it is possible to identify anything suspicious.

All transport vehicles / containers which may have come in contact with any G.E. organism will need to be appropriately cleaned, especially where any cross contamination is most likely to occur. (Often railway lines can be the source of dropped seeds from leaking train wagons.)

4. A total ban on foreign / imported products containing any genetically engineered ingredients. No recognition to any foreign patents on living organisms. Although this won't apply anyhow, because they will be banned regardless.

5. Financial aid given to farmers whose crops have been corrupted in the past. Individuals / corporations who were responsible for contaminating them should be held accountable.

6. Better education in schools as to why genetic research should not be abused the way it has in the past and in current times.

With these steps in mind, we can work towards being a more certain, safer and ethical country.
